

An extension of the formal model for a Library System

Dominic Rathbone

February 29, 2016

0.1 Abstract

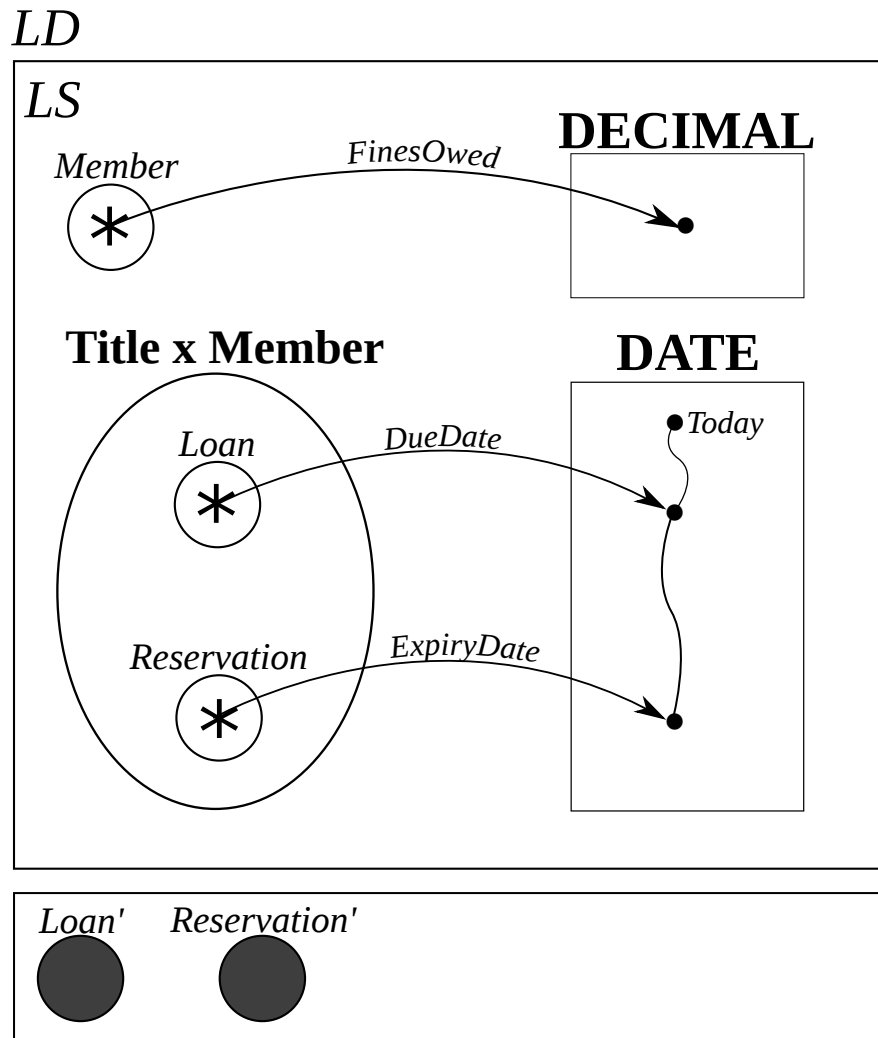

The goal of this coursework is to extend and refine the functionality of the existing library system by introducing the concept of time to it in accordance with the requirements given in the coursework document.

0.2 Class Invariant

0.2.1 Informal statement

In order to introduce the concept of time into the library system, a type named "DATE" is created and added to the class invariant. At this level, it is used to define a variable "today" which is the basis of the system's notion of time. The class invariant has also been extended to add reservations and loans by representing each as a subset of the set resulting from the cartesian product of the sets title and member. This way, each member of the loan set can be mapped to a "DATE" representing the due date and each member of the reservation subset can be mapped to another "DATE" representing the expiry date. Doing it this way also gives the system more flexibility as this set is not limited to reservations and loans, thus allowing for further extension. The invariant also contains a new addition to a member, "FinesOwed" which indicates how much money a member owes from overdue loans.

0.2.2 Formal statement

0.3 Move To Next Day

0.3.1 Informal statement

Using the "today" variable set up in the class invariant, the next day can be derived. To do so, a new event is created that takes in today's date and increments it by one as allowed by the "DATE" type.

0.3.2 Formal statement

$LD!moveToNextDay(today)$

DATE

•*today*

today' = today + 1

0.4 Reserve

0.4.1 Informal statement

The reserve event has to be updated to add a expiry date when a book is reserved. To do this, it has been updated to take new parameters, "dur" (reservation duration) and "today". A new reservation is made by pairing title and member which is then added to the reservation set. The expiry date is then calculated and linked to this reservation by the "ExpiryDate" function.

0.4.2 Formal statement

LD!reserve(title, member, dur, today → p)

LS!reserve(title, member → p)

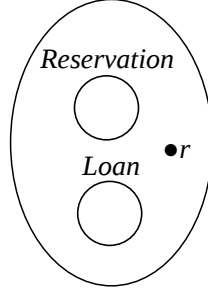

DATE

•today
•expiryDate

NAT

•dur

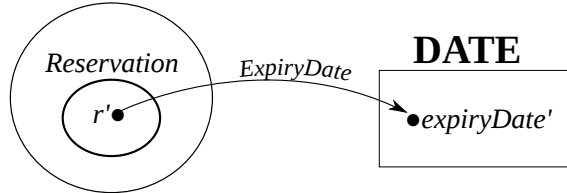

Title x Member

$r[1] = t$
 $r[2] = m$

$expiryDate' = today + dur$

Title x Member

0.5 LoanCopy

0.5.1 Informal statement

Similar to reserve, the loanCopy event has to be updated to add due dates to new loans taken out. To do this, it is extended to include to new parameters, dur(loan period) and today. The title and member passed through in the parameter is paired up to form a new loan. If the loan is then found to already exist as a reservation, the cancel event is called and the reservation is cancelled. After this, the due date is calculated by adding the duration to today and is linked to the loan by the "DueDate" function.

0.5.2 Formal statement

LD!*loanCopy*(title, member, dur, today \rightarrow p)

LS!*loanCopy*(title, member \rightarrow p)

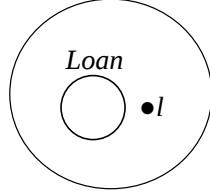

DATE

•today
•dueDate

NAT

•dur

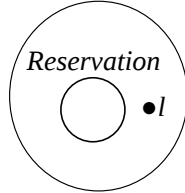

Title x Member

$l[1] = t$

$l[2] = m$

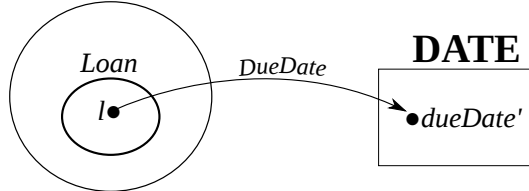

Title x Member

LD!*Cancel*(l \rightarrow p)

$dueDate' = today + dur$

Title x Member

0.6 Cancel

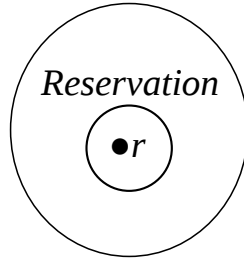

0.6.1 Informal statement

The cancel event is relatively simple, it takes a parameter, reservation "r". From which the title and member taken and passed through to the simple library system's cancel event in the postcondition, after this, the reservation is then removed from the set.

0.6.2 Formal statement

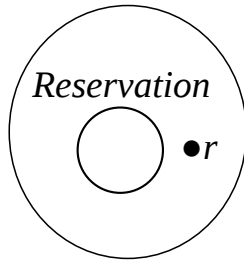

$LD!Cancel(r \rightarrow p)$

Title x Member

$LS!Cancel(r[1], r[2] \rightarrow p)$

Title x Member

0.7 Return

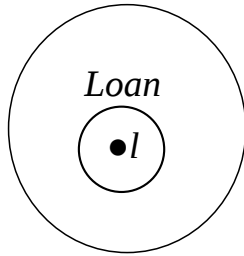

0.7.1 Informal statement

Again, similar to the cancel event, the new return event takes a loan as a parameter and uses the title and member with the simple library system's return event. The loan is then removed from the loan set.

0.7.2 Formal statement

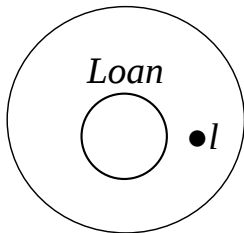

LD!Return(l)

Title x Member

LS!Return(l[1],l[2])

Title x Member

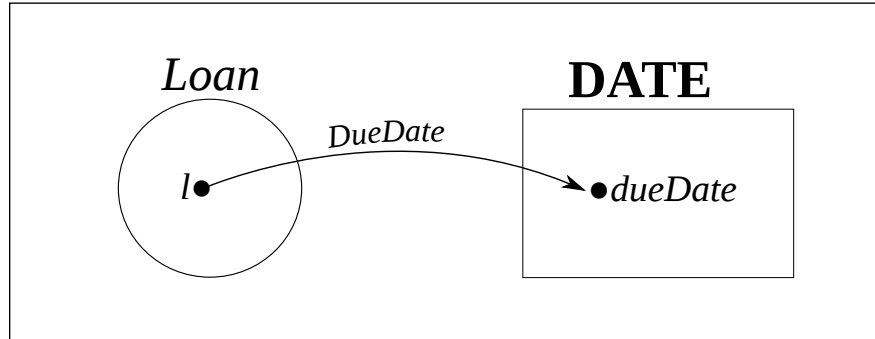

0.8 ShowDueDate

0.8.1 Informal statement

This event just takes in a loan and outputs the due date it has been associated with by the DueDate function.

0.8.2 Formal statement

$LD?showDueDate(l \rightarrow dueDate)$

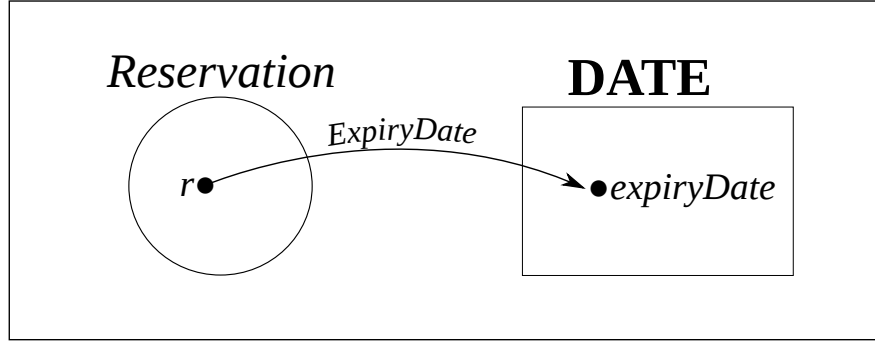

0.9 ShowExpiryDate

0.9.1 Informal statement

This event takes in a reservation and outputs the expiry date it has been associated with by the ExpiryDate function.

0.9.2 Formal statement

$LD?showExpiryDate(r \rightarrow expiryDate)$

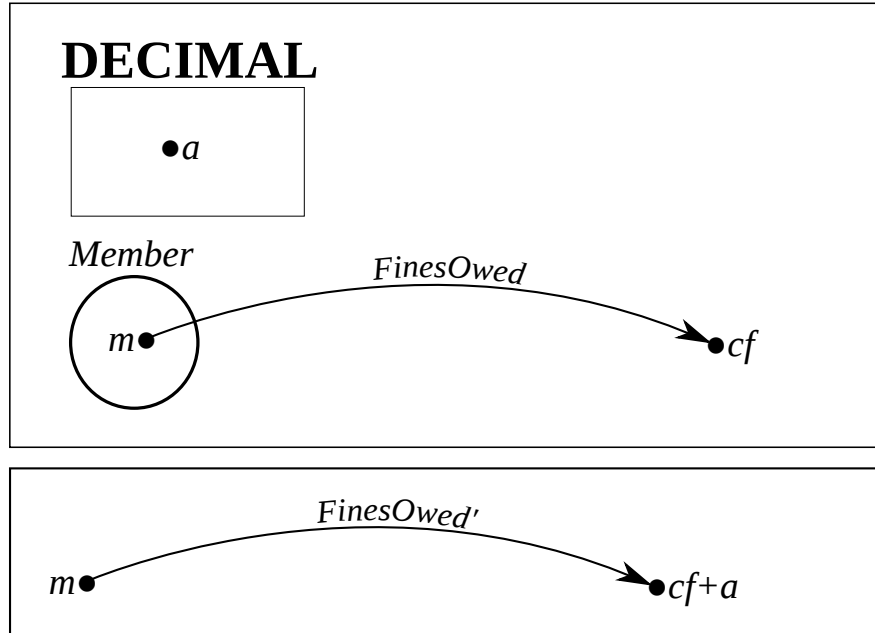

0.10 Fine

0.10.1 Informal statement

This event takes in a reservation and outputs the expiry date it has been associated with by the `ExpiryDate` function.

0.10.2 Formal statement

LD!Fine(m, a)

0.11 Pay Fine

0.11.1 Informal statement

This event takes in a reservation and outputs the expiry date it has been associated with by the `ExpiryDate` function.

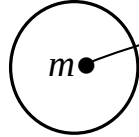

0.11.2 Formal statement

LD!payFine(m, a)

DECIMAL

• a

Member

FinesOwed

• cf

$cf > a$

$cf < a$

$a' = cf$

FinesOwed'

m •

• $cf-a$

0.12 Show Fines

0.12.1 Informal statement

This event takes in a reservation and outputs the expiry date it has been associated with by the `ExpiryDate` function.

0.12.2 Formal statement

$LD!showFines(m \rightarrow cf)$
